Ideation Phase

Brainstorm & Idea Prioritization Template

Date	08 October 2026
Team ID	SWTID-2026-2540
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

Brainstorming provides a free and open environment that encourages team participation in creative problem solving. For this project, the brainstorming focuses on making ServiceNow record access secure, understandable, testable and maintainable.

The source project restricts EEE branch records through a script-controlled READ ACL, while administrators retain full access; CREATE, WRITE and DELETE are controlled through separate roles.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Selected problem statement:

How might we ensure that users access only the Institution Details records and operations permitted by their roles and branch, while administrators retain the required full access?

Stakeholder perspectives:

- ServiceNow administrator / security administrator
- EEE branch user with bb1 role
- User without the required role
- Users requiring create, write or delete privileges through bb2, bb3 and bb4

Step-2: Brainstorm, Idea Listing and Grouping

Ideas generated and grouped around the selected problem:

Idea Group	Idea	Purpose
Access Control	Use separate ACLs for READ, CREATE, WRITE and DELETE operations.	Separates security decisions by operation.
Field-Based Security	Restrict READ access using the Branch = EEE data condition.	Prevents cross-branch record exposure.
Script Validation	Use an advanced script to allow administrators and bb1 users and deny others.	Adds explicit decision logic.
Role Separation	Use bb1 for READ, bb2 for CREATE, bb3 for WRITE and bb4 for DELETE.	Supports operation-specific permissions.
Impersonation Testing	Test access by impersonating users with different role combinations.	Validates real user behavior.
Negative Testing	Verify that a user without the required role cannot view protected records.	Confirms deny behavior.
Admin Override	Verify administrator visibility across EEE, ECE and CSE records.	Confirms administrator access.
Permission Matrix	Document role-to-operation permissions before implementation.	Makes configuration easy to understand.
Least Privilege	Assign only the operation-specific roles needed by each user.	Reduces unnecessary privileges.
Audit Documentation	Record ACL configuration and verification	Supports repeatable testing and review.

	results.	

Step-3: Idea Prioritization

Ideas are prioritized using the template's Importance–Feasibility view. Importance reflects security/user impact; feasibility reflects direct applicability to the existing ServiceNow ACL design.

Idea	Importance	Feasibility	Priority
Separate operation ACLs	High	High	P1
Branch = EEE data condition	High	High	P1
Role-specific bb1–bb4 permissions	High	High	P1
Impersonation and negative testing	High	High	P1
Advanced script validation	High	Medium	P1
Permission matrix/documentation	Medium	High	P2
Least-privilege role assignment	High	Medium	P2
Audit/documentation enhancement	Medium	Medium	P3

Selected concept: Layered ACL security combining the EEE field condition, role-specific operation permissions, script validation and impersonation-based verification.
